The measured loss is about ≈ 0.14 per cycle, and the sample needs at least ≥ 2 trials before the estimate settles. The yield was $\geq 90\%$ in every run.

A response rate of 95% was reported in 2024 for 12 participants, with a mean age of 34.5 years and a dose of 5 mg per kilogram [3]. See Figure 3 and Table 2 on page 7 (Section 4.1).

1. The first step takes 10 minutes.

2. The second step takes 25% longer than the first.
